GeneWars — Quick Start Guide

JLU-SPH iGEM & Tsinghua-A iGEM

This is a tower-defense education game with a **synthetic biology** theme. Gameplay follows classic tower defense, but it adds **ATP agents** and **gene-editing** mechanics.

How to start

1. Keep the whole game folder **together** (do not split it — the main program and the resource pack must stay in the same directory).
2. Double-click the launch script **Start_Game.cmd** (or the Chinese version **启动游戏.cmd**).
3. Wait a few seconds for the game program to start.
4. Controls are like classic tower defense: **collect sun → pick a plant card → plant it on the lawn to block the infected**.

New mechanics (the important part)

> **ATP agents**: click, then **drag onto a plant** — it only takes effect when dropped on a plant.

Green ATP = safe enhancement

- Pea-shooting plant attack speed ×1.3–1.5
- The sun-producing fungus plant grows instantly

Red ATP = extreme enhancement

- The plant bursts a huge volley / a lot of sun, then **dies** (use with care!).

Fungus-type plants (ice / doom / hypno area fungi)

These can **gene-edit** plants or infected **within range** (the infected revert to normal infected).

The infected evolve too

Once infected they break apart and turn green, speeding up; helmet / bucket carriers grow biofilms; the commander type summons reinforcements.

Stuck / want to restart

Double-click **Reset_Save_Start.cmd**: it clears the save and restarts the game.

Tips

- Click "Background Story" in the game for the full world-building (the infected bio-experiment / the scientist's ATP agents).
- This is a **Windows** program — unzip it and keep the whole folder together.
- Want to send it to someone for testing? Use **制作便携评测包.cmd** to build a portable package.
