Safeguarding Life · Public Health

JLU-SPH

2026 Kindergarten Seven-Step Handwashing Health Science Education Program Proposal

Guarding life with a scientific heart

Responding to public health with collaborative strength

School of Public Health, Jilin University

School of Public Health Jilin University

I. Basic Information of the Activity

- **Activity Name:** Little Clean Hands, Healthy Companionship — Health Education on the Seven-Step Handwashing Method for Kindergarten Children
- **Activity Theme:** Fun Handwashing to Safeguard Health
- **Activity Type:** ☑Public Welfare Service ☑Educational Science Popularization ☐ Cultural Promotion ☐Community Service ☐Others:
- **Organizing Unit:** JLU-SPH Team

II. Purpose of the Activity

1. **Core Purpose:** To provide science-based health education on handwashing for kindergarten children, utilizing engaging and interactive methods to promote the importance of handwashing and the Seven-Step Handwashing Method, thereby helping children develop scientifically sound hygiene habits and establishing the first line of defense against the transmission risk of respiratory and gastrointestinal infectious diseases at the source.

2. **Specific Objectives:**

- Cognitive/Knowledge Level: Enable children to understand the presence of invisible germs on their hands, recognize that not washing hands can lead to illness and transmission to peers, and identify key moments for handwashing such as before meals, after using the toilet, after returning from outdoors, after playing with toys, and after coughing or wiping their nose.
- Behavioral/Skill Level: Enable more than 80% of children to independently complete all steps of the Seven-Step Handwashing Method , emphasizing the use of soap/hand sanitizer and rubbing hands for more than 20 seconds.
- Emotional/Attitudinal Level: Inspire children's willingness to wash hands proactively, cultivate an initial sense of responsibility for their own health, and help them develop a positive attitude toward hygiene through enjoyable experiences.

3. **Expected Outcomes:**

- Number of Children Reached: Approximately 20–30 children.
- Children can verbally state the importance of handwashing and remember the key moments for handwashing.
- More than 80% of children can independently perform the steps of the Seven-Step Handwashing Method.
- Completion of comprehensive activity documentation and feedback on effectiveness.

III. Target Audience

- Core Audience: Kindergarten children (ages 3–6)
- Audience Characteristics: Highly curious and imitative, with short attention spans (approximately 5–10 minutes), fond of interactive games and companionship, have weak hygiene awareness, and lack understanding of microbes such as bacteria and viruses; this is a critical period for developing hygiene habits, making them the primary beneficiaries of the activity's effectiveness.

IV. Activity Date and Venue

- Activity Date: April 27, 2026
- Total Duration: Approximately 50–60 minutes
- Venue: The Second Kindergarten of Jilin Provincial Government Organs

1. Location for Health Education and Teaching: Kindergarten Multi-Function Classroom/Activity Room
2. Location for Practical Training: Kindergarten Washroom/Handwashing Station (or classroom sink simulation area)

V. Activity Content and Flow

[Overview of Activity Flow]

Stage	Time	Session Name	Detailed Content	Responsible Personnel	Materials Needed/ Photography Focus
Stage	10 min	Venue Setup and Materials Preparation	Classroom setup (desks and chairs, projection equipment); posting of handwashing step charts and pathogen illustrations; children's version of the science popularization PowerPoint (PPT), soap/hand sanitizer, towels, washbasins, etc. Team members are assigned specific roles and are familiar with the presentation script and mnemonic rhymes.	General Supervisor, Logistics	Computer, projector, handwashing step illustrations, drawings, banner
Main Stage	10 min	**Session 1: Introduction and Science Popularization**	Begin with the story "Invisible Little Germ Villains" to communicate, in simple language and with illustrations, that hands harbor pathogenic microorganisms and that failing to wash hands can cause illness and transmit diseases to peers. Clearly explain critical moments for handwashing, including before meals, after toileting, after returning home, after playing with toys, and after coughing or wiping the nose.	Professional Instructor, Photographer	Children's version of the science popularization PPT, pathogen illustrations, camera

Main Stage	15 min	**Session 2: Interactive Teaching of the Seven-Step Handwashing Method**	Use the mnemonic paired with demonstrated actions to guide children step-by-step in imitation. Throughout, emphasize the use of soap/hand sanitizer and scrubbing for over 20 seconds. Team members crouch alongside children to provide guidance and correct errors.	Professional Instructor, Teaching Assistants (2–3 people), Photographer	Handwashing steps illustrations, soap/hand sanitizer, timer, camera

Main Stage	10 min	**Session 3: On-Site Practical Training and Correction**	Organize children into groups to practice at the washroom (or sink simulation area). Team members provide one-on-one or one-on-two guidance, correct handwashing movements, and encourage children to actively participate. Invite children who are willing to demonstrate in front, fostering a relaxed and cheerful atmosphere.	Teaching Assistants/Volunteers (2–3 people), Caregivers/Teachers in coordination, Photographer	Soap/hand sanitizer, towels, basins (if using simulation), camera
Conclusion Stage	5 min	**Session 4: Summary and Reinforcement of Knowledge**	Lead the children in repeating together the mnemonic "Palm, Back, Interlace, Knuckle, Rotate, Tip, Wrist" and the key moments for handwashing (e.g., "Wash hands before eating and after using the restroom"). Assess learning through verbal Q&A (e.g., "When should you wash your hands?" "How long should you scrub your hands?"). Share the cultural motto: "Clean hands chase germs away, healthy growth every day!"	Professional instructor, overall supervisor, photographer	No special materials / Record interactive shots of children raising their hands to answer and reciting mottos in unison

[Detailed Explanation of Each Stage]

- **Session 1: Introduction and Science Popularization**

o Core Content: Begin with the story of the "Invisible Germ Villains" using child-friendly language to explain that germs on hands can cause fever and diarrhea. If hands are not washed, these germs could be ingested or transmitted to friends. Utilize germ illustrations to enhance visual recognition. Clearly explain critical handwashing moments: before eating, after using the restroom, upon returning home, after playing with toys, and after coughing or wiping the nose. Use specific scenarios to help children remember.

- Interaction and Filming: During explanation, pose questions (e.g., “Children, do you think there are ‘bad germs’ on your hands?” “When should you wash your hands?”) to encourage children to raise their hands and answer.Film children listening attentively, raising their hands to interact, and capturing moments of surprise or curiosity.
- Key Speaking Points: “Children, did you know? There are many invisible germ villains hiding on our hands! If we don’t wash them, they can get into our bodies and cause fever, diarrhea, and even transmit to friends!” “Wash hands before eating and after using the restroom; what’s the first thing to do when you come home?—That’s right, wash your hands!”

■ **Session 2: Interactive Teaching of the Seven-Step Handwashing Method**

- Core Content: Use the simplified version of the six-step mnemonic alongside action demonstrations. Break down teaching into steps: ① Palms rubbing together (Palm), ② Backs of hands scrubbed (Back), ③ Fingers interlaced (Interlace), ④ Backs of fingers in palms (Knuckle), ⑤ Rotating (Rotate), ⑥ Tips rubbing in palms (Tip), ⑦ Wrists washed (Wrist). Emphasize the use of soap/hand sanitizer and scrubbing for a count of 20 seconds. Assistants crouch beside children to guide and correct handwashing technique.
- Interaction and Filming: Lead children to recite the mnemonic while mimicking actions; groups may compete to see who remembers fastest. Film close-ups of the assistant crouching to instruct, children carefully copying actions, and lively scenes of collective handwashing exercises.
- Key Speaking Points: “Let’s recite together: ‘Palm, Back, Interlace, Knuckle, Rotate, Tip, Wrist!’” “Scrub and count to 20 seconds; you can softly sing the ‘Happy Birthday Song’!”

■ **Session 3: On-Site Practical Training and Correction**

- Core Content: Organize children in groups (4–5 per group) to the washroom or classroom basin simulation zone, using soap/hand sanitizer for actual handwashing. Each team member accompanies 2–3 children, observing and correcting actions (such as missed wrists or insufficient scrubbing time). Encourage children to operate boldly and invite those with standard technique to demonstrate, giving immediate applause and verbal praise.Applaud and verbally praise the child for well-executed actions.
- Precautions: Ensure that water temperature is suitable and the floor is slip-proof; teachers or facility staff should be present to help maintain order; team members should maintain a crouched or bent posture to meet children at eye level, using gentle and encouraging language.
- Key Speaking Points: “Wow, you did a great job! Remember to rotate, too!” “Who wants to show everyone? Okay, you come up!”

■ **Session 4: Summary and Reinforcement of Knowledge**

- Core Content: Guide all children to recite in unison the “Internal and external clamping arch with elevated wrist” mnemonic and 2–3 key handwashing moments (such as “before eating and after using the restroom,” “after playing with toys”). Conduct rapid verbal Q&A (“What happens when hands are clean?” “—All germs run away!”). Everyone recites the cultural motto together: “Clean hands chase germs away, healthy growth every day!” to conclude the activity.
- Interaction and Filming: Capture lively shots of children raising their hands to answer and reciting mottos together. Record teachers’ immediate oral feedback about the activity’s effectiveness.

VI. Staffing and Division of Labor

- Overall Supervisor (1 person): Coordinates the whole process, liaises with the kindergarten, manages procedure and timing, hosts the summary and consolidation segment.
- Professional Instructor (1 person): Responsible for explaining and demonstrating in stages 1 and 2; must be expressive with engaging, child-friendly communication to attract children's attention.
- Teaching Assistant/Volunteer (2–3 people): Responsible for accompanying and guiding children during stage 3 practical instruction, crouching to assist handwashing techniques and correcting errors; supports the instructor in interactive teaching. Must be patient, approachable, and skilled in communicating with young children.
- Logistics/Photographer (1–2 people): Responsible for continuous filming throughout. Must closely coordinate with stage supervisors to capture children's interactive expressions, action close-ups, and group scenes. Ensure devices are fully charged before filming.

VII. Materials List

■ Publicity and Educational Materials:

o Children's version of the science popularization PPT (including pathogen illustrations)

o Diagram of the Seven-Step Handwashing Technique (A3 color poster, displayed on the wall in the handwashing area)

o Hand-held germ signboards/illustration display panels

o Banner ("Clean Hands, Healthy Together")

■ Equipment:

o Laptop, projector

o Camera/High-definition smartphone (ensure sufficient battery, core device)

■ Props (for practical instruction):

o Children's soap/hand sanitizer (2–3 bottles)

o Hand towels/paper towels (adequate supply)

o Wash basins (for classroom handwashing simulation if washroom is unavailable)

o Timer (or stopwatch function on phone, for timing 20 seconds)

VIII. Risk Management

- Children inattentive/disorderly: Communicate thoroughly with class teachers beforehand; ensure classroom teachers assist with order throughout; limit the lesson content to within 10 minutes with changing formats (explanation → action mimicry → practical instruction), ensuring engagement and rhythm; use hand-held signs as visual aids.
- Filming difficulties: Photographer to familiarize with the process in advance, discuss shooting requirements with stage supervisors; prepare backup devices; prioritize capturing key interactive moments rather than posed shots.

- Safety hazards in practical instruction: Check washing area floors for slip-proof condition in advance, lay anti-slip mats; ensure suitable water temperature (warm water); place soap/hand sanitizer within children's reach but not easy to drop; assistants focus one-on-one throughout to avoid children pushing or scrambling.
- Some children resistant to participation: Do not force, teachers or team members should gently encourage ("Let's watch other children first, and you try later, okay?"); let active children demonstrate first to spark interest among reluctant children.

IX. Effectiveness Evaluation

- Process Recording: Use photographic material as core evaluation evidence, covering the entire process including science explanation, interactive teaching, handwashing exercise instruction, practical correction, and summary Q&A.
- Immediate Effect Evaluation: Assess on-site via oral Q&A ("When should you wash your hands?" "How long should you scrub?") and action observation, recording children's understanding of handwashing timing and the seven-step handwashing technique.
- Outcome Statistics: Record the number of participating children (target: 20–30); tally those able to state the importance of handwashing and remember critical moments; count the proportion of children able to complete the handwashing steps independently (target: more than 80%).
- Delayed Effect Feedback: 1–2 weeks after the activity, assess development of hygiene habits via feedback from kindergarten teachers and records of children's handwashing behavior (observed daily by teachers).
