回溯性共情问卷

问卷设计理念： 调用病痛记忆，验证设计的包容性。

交互形式： 问卷采用大字版（便于恢复期视力疲劳者阅读），并附带我们的改良后样机供其试用。

核心问题架构（Scenario-Based Recall）：

关于视觉：

“请回忆您发烧最严重、看东西模糊的时候。拿着现在的这个设备，您觉得那个占据全屏的‘绿色/红色’背景，能让当时的您一眼看懂结果吗？”

□ 能，不需要动脑子看字

□ 不能，必须得看清字才放心

关于操作：

“当您浑身没力气的时候，相比于拧开一个小瓶盖，这个‘推一下就滑开’的设计，会减少您的烦躁感吗？”

□ 极大地减少，我会愿意用它

□ 没什么区别，都很累

关于焦虑：

“如果不小心把用过的检测盒掉在地上，现在的‘自动卡死’和‘内置消毒’功能，能让您在那一刻少一些‘传染给家人’的惊慌吗？”

□ 会，心里石头落地了

□ 不会，我还是会担心

The Retrospective Empathy Survey

Design Concept: Evoking memories of illness to verify the inclusivity of the design.

Interaction Format: The survey utilizes a large-print format (to ease reading for those experiencing visual fatigue during recovery) and is accompanied by our modified prototype for users to test.

Core Question Framework (Scenario-Based Recall):

Regarding Vision (The Fever Vision Test):

"Please recall the moment when your fever was at its highest and your vision was blurry. Holding this current device, do you think the full-screen green or red background would have allowed you to understand the result at a single glance back then?"

□ Yes, without needing to process or read any text.

□ No, I would still need to read the text clearly to feel reassured.

Regarding Operation (The Weak Hand Test):

"When you were experiencing profound physical weakness, compared to twisting open a small bottle cap, would this 'push-to-slide' design have reduced your frustration?"

□ Significantly reduced; I would be willing to use it.

□ No difference; both are exhausting.

Regarding Anxiety (The Safety Test):

"If you accidentally dropped the used test kit on the floor, would the current 'auto-lock' and 'built-in disinfection' functions reduce your panic about potentially infecting your family in that moment?"

□ Yes, it gives me peace of mind.

□ No, I would still worry.
